

Conclusions

Busan, South Korea, August 5th-9th

During the closing session several participants give their opinions about the NASE course finished.

We introduce here some of them

- The practical activities consisted of simple and interesting things, which were good to use in the field. The theory lectures related to the practical were also held together, which was very helpful. The special lecture was a special time with people who loved astronomy and touched the field of astronomy in real life. Overall, I feel that the composition of the content is better than the job training run by the local education office. Thank you.
- It seems that the practical contents can be used immediately during the science club activities. I thought that I could try to find a simple inquiry related to the content of the curriculum by myself.
- It is very useful course for teachers. I really enjoyed.
- If you want to learn about astronomy and are looking for activities you can do with your students, I recommend this training.
