Local Horizon and Sundials

Rosa M. Ros

International Astronomical Union Technical University of Catalonia, Spain

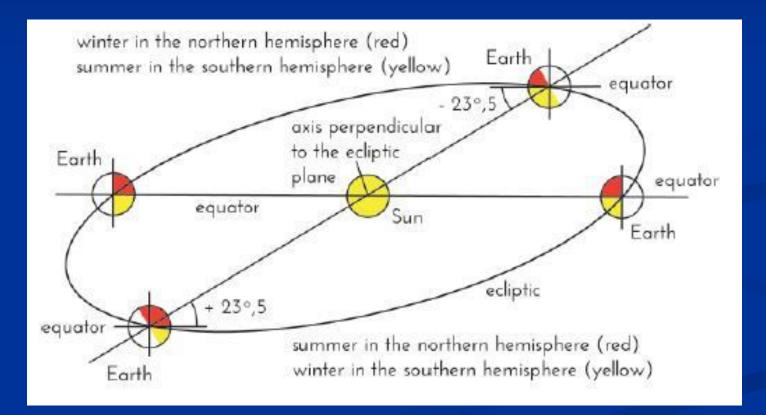

Goals

Understand the diurnal movement of the Sun
Understand the annual movement of the Sun
Understand the movement of the celestial sphere
Understand the construction of sundials

The Earth rotates and moves rotation (day / night) orbital position (seasons)

Activity 1: Four Earth spheres with the Sun (a lamp) in the middle. The line from the centre of the Sun to the centre of the Earth makes a 23.5° angle with the ground (which represents the plane of the Equator).

Winter in the Northern Hemisphere

Summer in the Southern Hemisphere

Summer in the Northern Hemisphere

Winter in the Southern Hemisphere

A spotlight illuminates two spheres in the same way and produces the same areas of light and shadow

* Remove the globe from its mounting, take it outside and stand it on a glass

* Carefully orientate its rotational axis with a compass

* Turn it so our location is at the top

Place:

* a doll indicating our position

* pieces of clay to mark
the light / shadow line
(it advances with time)

* pieces of toothpick to create shadows to study

* The North Pole is on the sunny side so it is summer in the Northern Hemisphere (the midnight sun)

* The South Pole is in shadow and therefore in the Southern Hemisphere it is winter

* The North Pole is within the area at darkness, so it is in the Northern hemisphere's winter.

* South Pole is illuminated and so it is summer in the Southern hemisphere.

When the day / night shadow line passes through both poles, it is the first day of spring or the first day of autumn.

North H. summer North H. equinoxes North H. winter

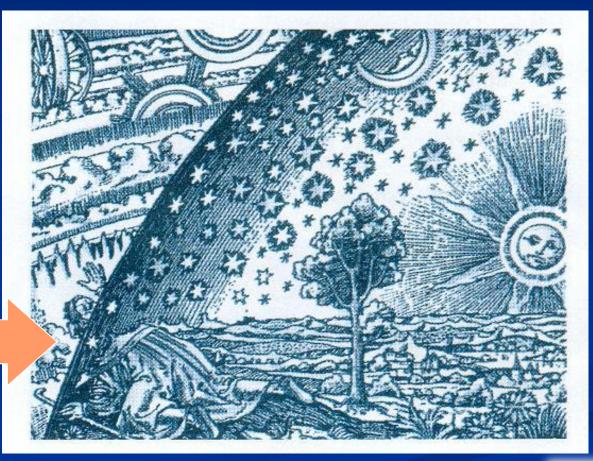

South H. winter South H. equinoxes S

South H. summer

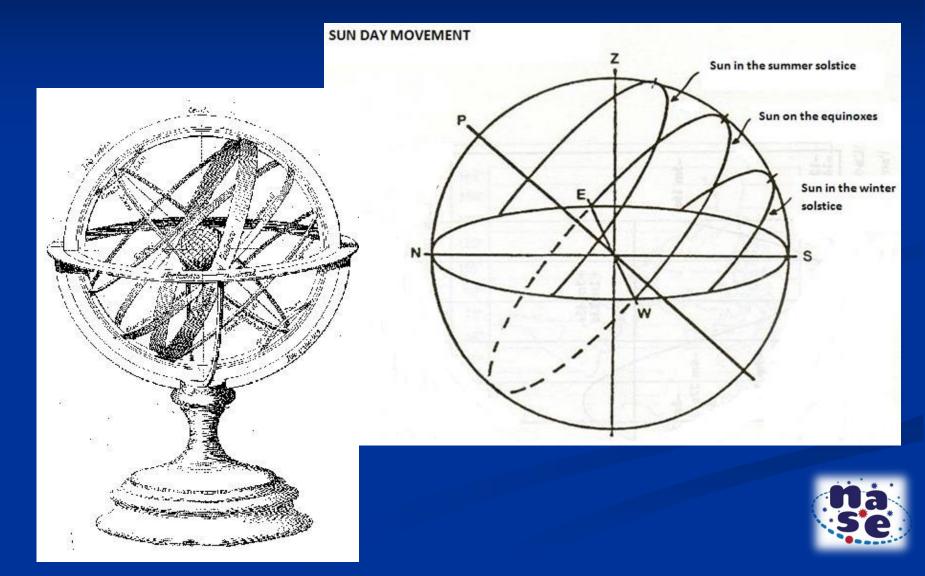

Rotation and celestial movements of day and night

Not the same
 when seen
 from inside
 and outside

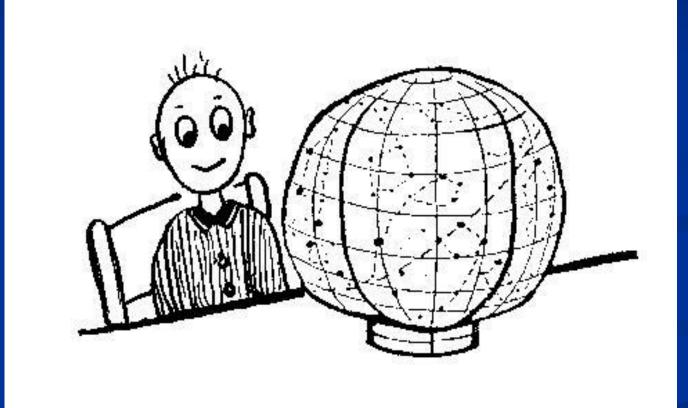

Celestial sphere "from outside"

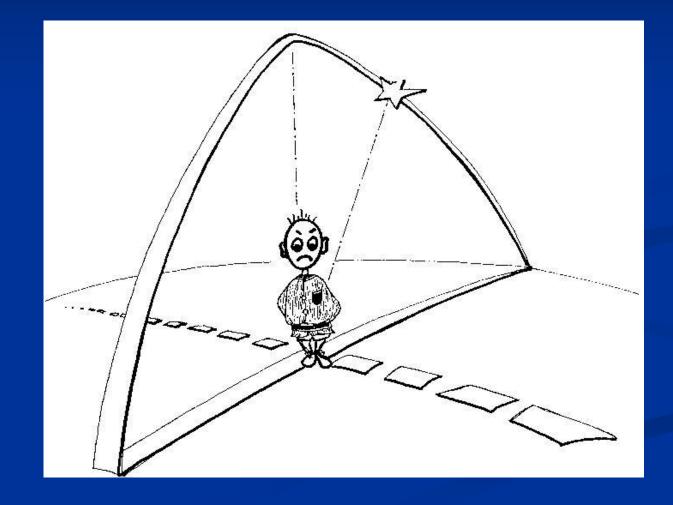

... it seems that everything is understood

... but after class, ... he is disconcerted

All schools have an "Astronomy Laboratory"

They have a playground or school yard
They have the sky above
They have clear days and nights
THESE MUST BE USED!

Activity 3: We will build a model of the horizon visible from school

Begin by photographing all round your location

local horizon

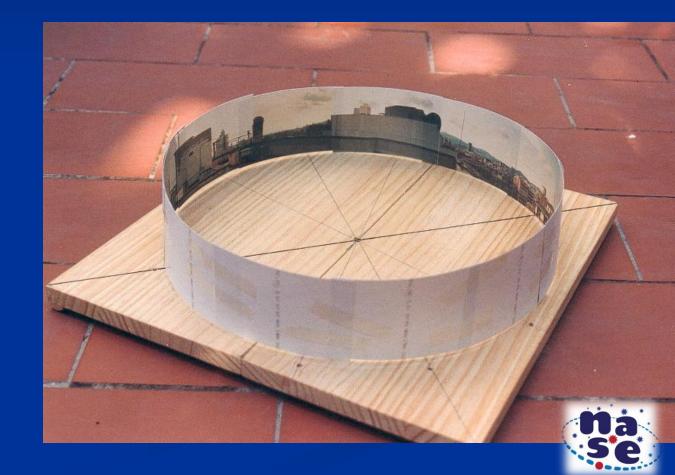

Figure 1: Zona del horizonte fotografiada en Barcelona. 1 Catedral, 2 Montjuic, 3 Tibidabo, 4 Sagrada Familia, 1 Catedral.

Rosa M. Ros

Let's glue the photos together on a supporting platform

local horizon

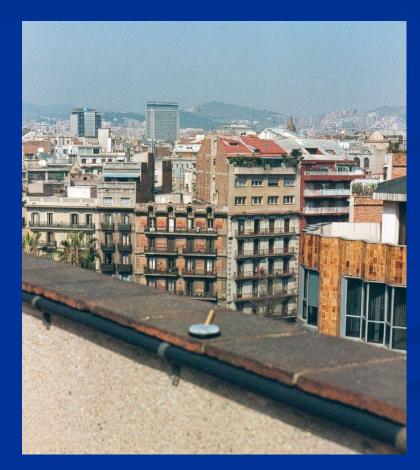

... we must adjust the photographed horizon to align it with the real horizon

The N - S line and local meridian

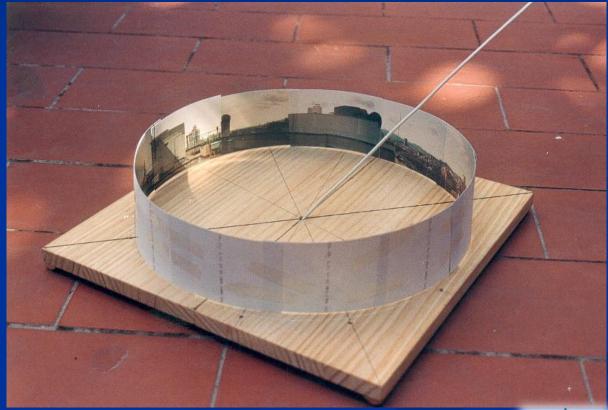

To position the model we can use the compass direction, or better, we can use the projection of the pole above the horizon

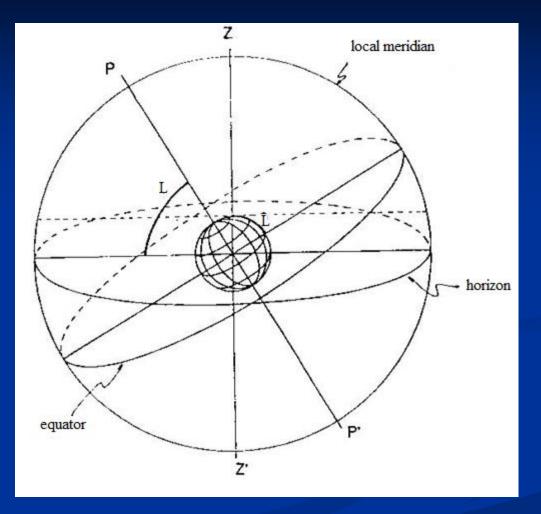

Introducing the Earth's rotation

axis of the Earth

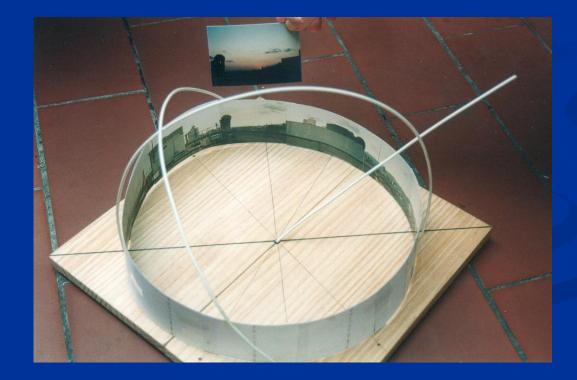

The altitude of the pole is equal to your latitude

Indicate the apparent path of the sun on the first day of spring or autumn

Use the Sunrise or Sunset photos

Movement due to Earth's rotation: Note the angle of the Sun's path

Day - several images near sunset

Movement due to Earth's rotation: Note the angle of the star trails

Night – a time exposure of the stars

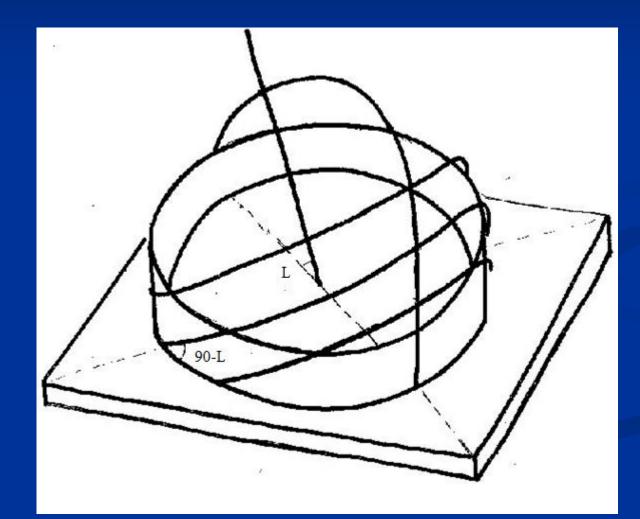

Rotational movement in the model

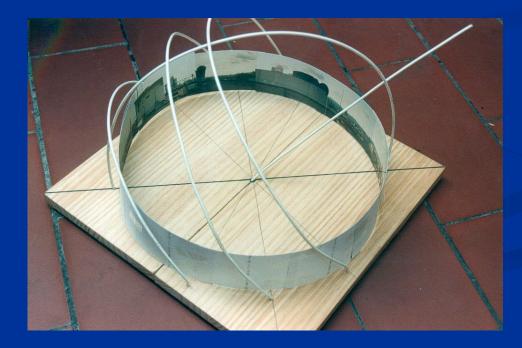

The inclination of the Sun's apparent path and of the star trails depend on latitude

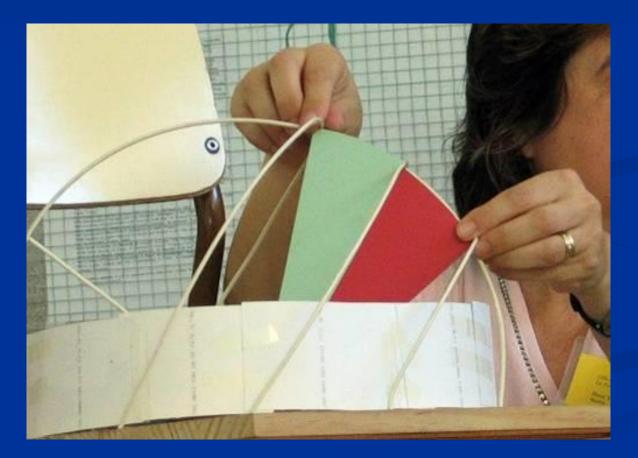

Solar paths on first day of each season (note the different durations)

Summer Solstice
Autumnal / Vernal Equinox
Winter Solstice

Orbital motion leads to the seasonal positions

Summer

Spring / Autumn **Winter**

Angle between equator and **Tropic** of Cancer or **Tropic of** Capricorn : 23.5°

The Earth's orbital motion leads to the change of the position of sunsets every day

3 sunsets:
 Winter – Spring or Autumn – Summer

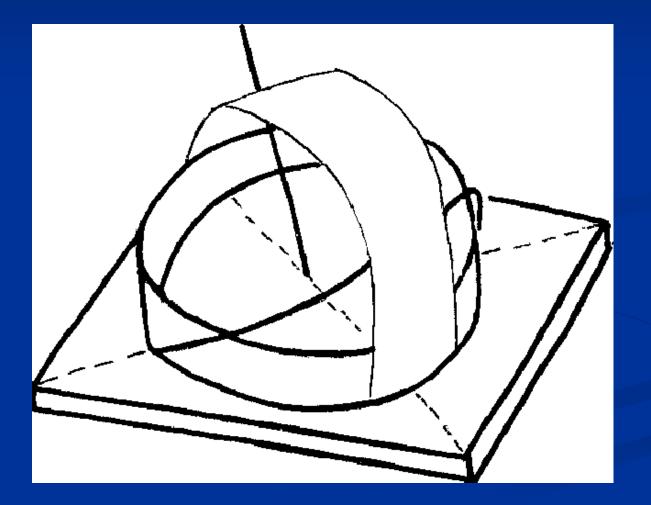

The Earth's orbital motion leads to the change of the position of sunrises every day

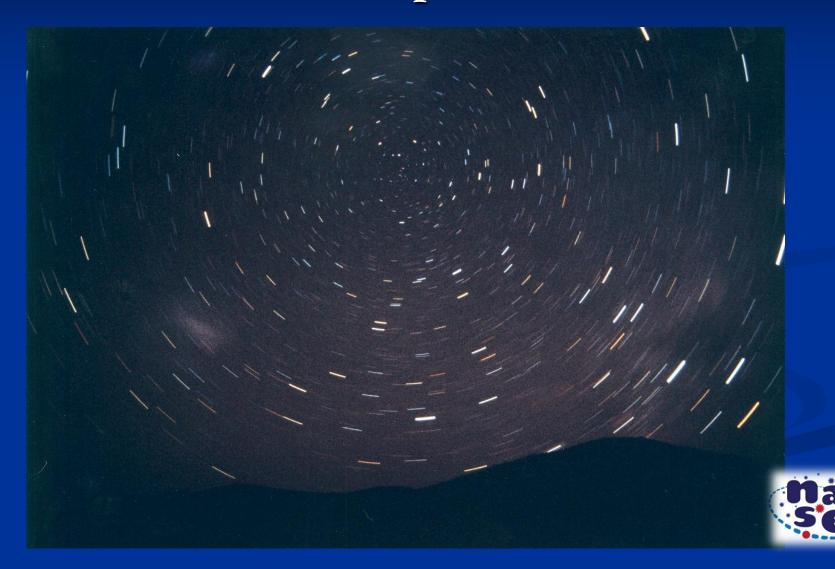

Viewing the "meridian" in the model

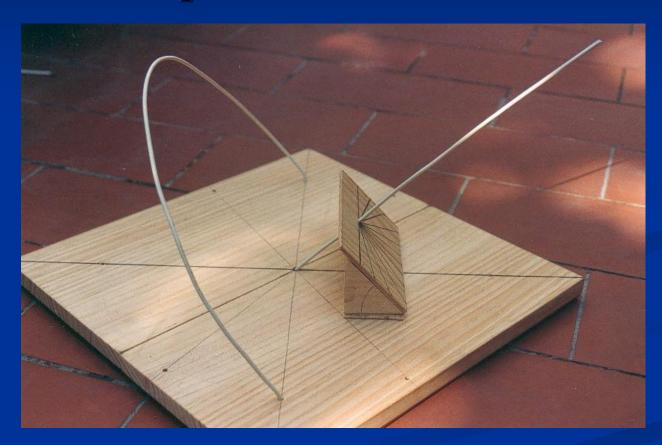

... around the pole - circles

...near the equator the paths change from concave to convex

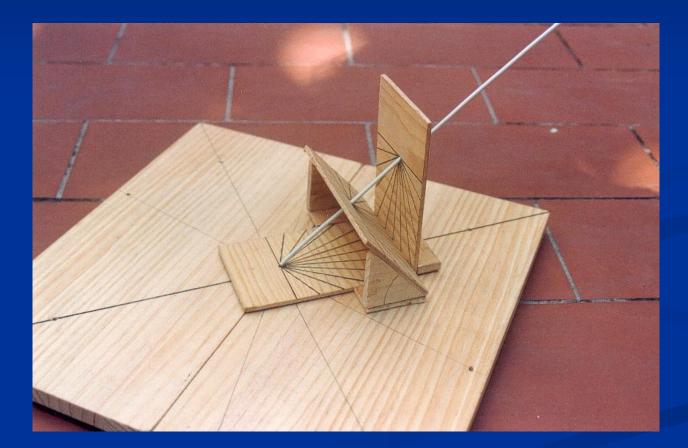

...the model is no more than an Equatorial Sundial!

...other sundials can be made from the equatorial one

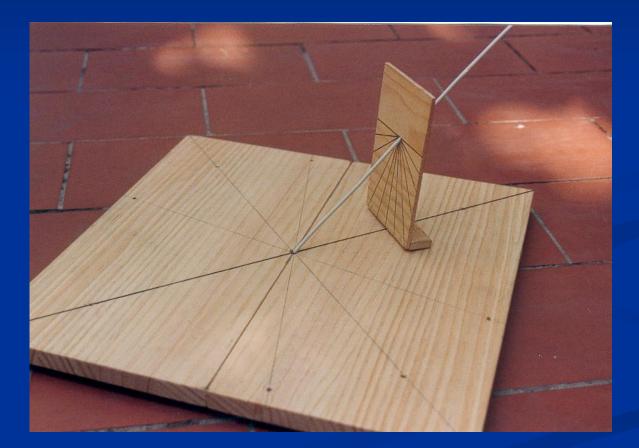

... the horizontal sundial

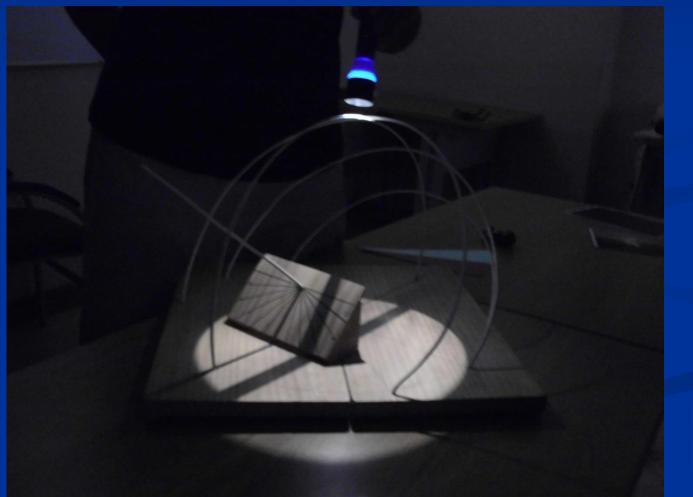

...and the vertically oriented E-W sundial

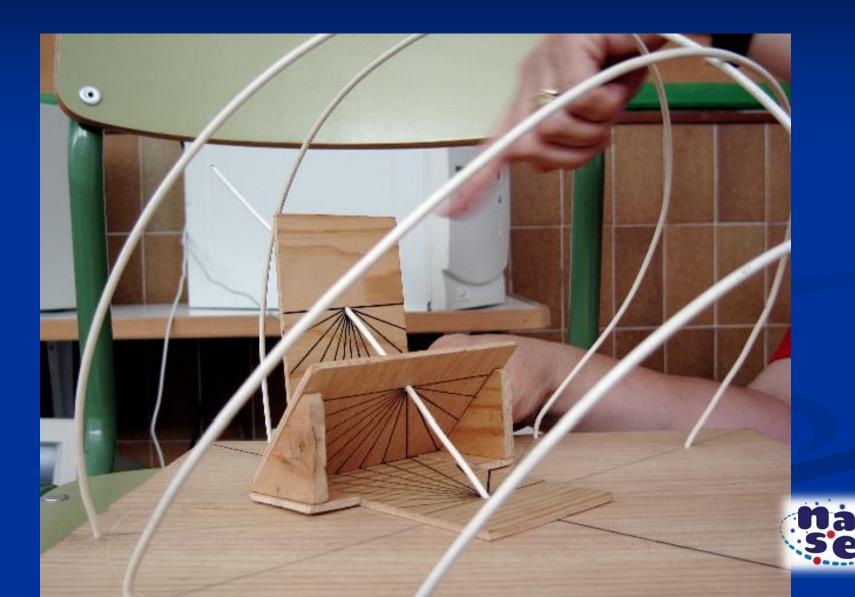

... and with the Sun (or with a flashlight) we observe the model acting like a sundial

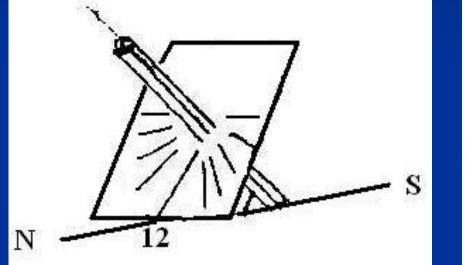

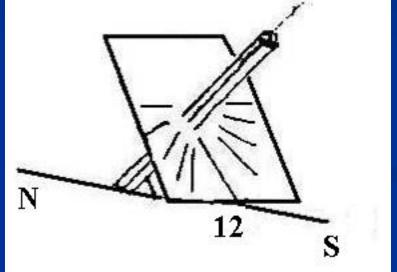

The three sundials in the model

Activity 4: Let's see how to build a very simple "equatorial" sundial!

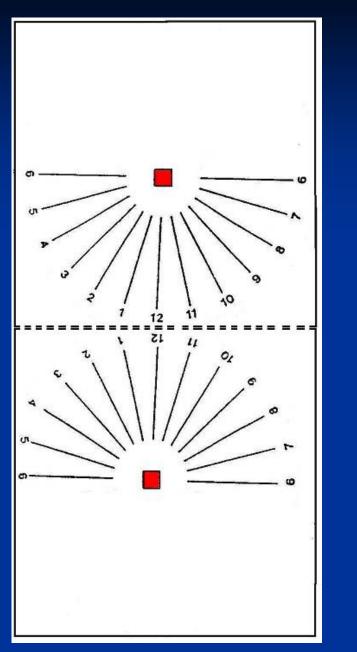

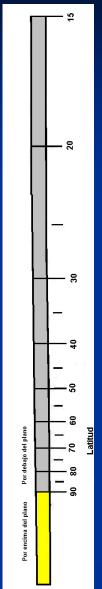

Northern Hemisphere

Southern Hemisphere

Activity 4: "equatorial" sundial!

Fold the pattern along the dotted line
Cut the stylus for your latitude. The yellow part goes above the plane

Activity 5: How to Read the Time

Solar Time + Total Adjustment = Wristwatch Time

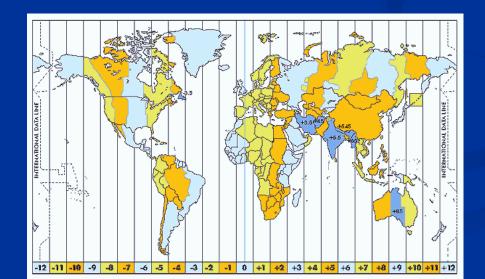

Total Adjustment =

- Longitude Adjustment
- Summer / Winter Adjustment
- Equation of Time Adjustment

Activity 5: Read the time, Longitude Adjustment

- The world is divided into 24 time zones from the Zero or Greenwich meridian.
- We must know the local longitude and "Standard' meridian longitude of your area.
- Use sign + to the East and sign to the West.
- Write longitudes in h, m and s (1°=4m).

Activity 5: Read the time, Summer / Winter Adjustment

Many countries add an hour in summer.
This change of clocks for summer / winter is a decision of the government of the country.

Activity 5: Read the time, Equation of Time Adjustment

•The Earth revolves around the Sun according the law of areas, i.e. not a constant motion. We define the average time (of mechanical watches) as the average over a full year.

•The equation of time is the difference between "Real Solar Time" and "Mean Time" in minutes of time

day	Jan	Feb	Mar	Apr	Мау	Jun	Jul	Aug	Sep	Oct	Nov	Dec
1	+3m 33s	+13m 35s	+12m 22s	+3m 54s	-2m 54s	-2m 12s	+3m 50s	+6m 21s	+0m 2s	-10m 18s	-16m 24s	-11m 1s
6	+5m 50s	+14 m 5s	+11m 17s	+2m 27s	-3m 23s	-1m 22s	+4m 45s	+5m 54s	-1m 23s	-11m 51s	-16m 22s	-9m 1s
11	+7m 55s	+14m 14s	+10m 3s	+1m 4s	-3m 38s	-0m 23s	+5m 29s	+5m 13s	-3m 21s	-13m 14s	-15m 31s	-6m 49s
16	+9m 45s	+14m 4s	+8m 40s	-0m 11s	-3m 40s	+0m 39s	+6m 3s	+4m 17s	-5m 7s	-14m 56s	-15m 15s	-4m 27s
21	+11m 18s	+13m 37s	+7m 12s	-1m 17s	-3m 27s	+1m 44s	+6m 24s	+3m 10s	-6m 54s	-15m 21s	-14m 10s	-1m 58s
26	+12m 32s	+12m 54s	+5m 42s	-2m 12s	-3m	+2m 49s	+6m 32s	+1m 50s	-8m 38s	-16m 1s	-12m 44s	+0m 31s
31	+13m 26s		+4m 12s		-2m 21s		+6m 24s	+0m 21s		-16m 22s	·	+2m 57s

Activity 5: Reading Time

Example 1: Barcelona (Spain) on May 24th

Adjustment	Comment	Result	
1. Longitude	Barcelona is in the same "standard" zone as Greenwich. Its longitude is 2° 10' $E = 2.17^{\circ} E = -8.7$ m (1° is equivalent to 4 m)	-8.7 m	
2. Summer Time	May has daylight saving of +1 h	+ 60 m	
3. Equation of Time	We read the table for May 24 th	-3.4 m	
Total		+47.9 m	

For example at 12h of solar time (noon), our watches indicated (Solar time) 12h + 47.9 m = 12h 47.9 m (wristwatch time)

Activity 5: Reading Time

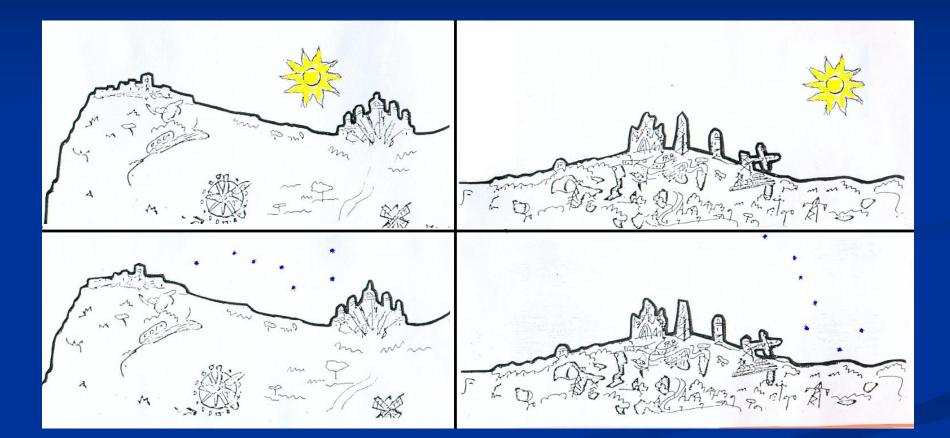

Example 2: Tulsa, Oklahoma (USA) November 16th

Adjustment	Comment	Result
1. Longitude	The standard meridian of Tulsa is $90 \circ W$. Its longitude is $95^{\circ} 58' W = 96 \circ W$, so it is $6^{\circ} W$ from the standard meridian (1° is equivalent to 4 m)	+24 m
2. Winter Time	November 16 th does not have daylight saving added	0
3. Equation of Time	We read the table for November 16 th	-15.3 m
Total		+ 8.7 m

For example at 12h solar time (noon), our watches will indicate (Solar time) 12h + 8.7 m = 12h 8.7 m (Wristwatch time)

the model serves to orientate us ...

... to observe and understand ...

Conclusions

- We understand the "views" of the model from inside and outside
- We reach levels of abstraction that let us read books and make comments
- We feel oriented to the real horizon
- We see that the sunrise is not always due East and that the Sunset is not always due West

Thank you very much for your attention!

Rosa M. Ros
